AET Report No. 02-02098  
MPCA File No. VP [yet to be assigned]

Dear Mr. Lockwood:

American Engineering Testing, Inc. has completed the enclosed report of Phase II Investigation services for the Ramsey County Riverfront Properties Site. This investigation was performed in accordance with our Phase II Work Plan which the Minnesota Pollution Control Agency authorized on July 3, 2014.

The report is being forwarded to the MPCA for their review. We appreciate the opportunity to have been of service to you on this project. If you have any questions regarding the information presented in this Phase II Investigation Report or if we can be of additional assistance, please contact us.

Sincerely,  
**American Engineering Testing, Inc.**

## EXECUTIVE SUMMARY

American Engineering Testing, Inc. (AET) was authorized by Loucks Associates to conduct a Phase II Investigation for the Ramsey County Riverfront Properties located at 12/14 & 50 Kellogg Boulevard West in St. Paul, Minnesota.

### Findings and Opinions

This Phase II Investigation has revealed the following information regarding the potential environmental conditions assessed in connection with the Site:

- There were diesel range organics (DRO) and semi-volatile organic compounds (SVOCs) detections exceeding Minnesota Pollution Control Agency (MPCA) unregulated fill criteria and MPCA Industrial Soil Reference Values (SRVs) measured in the fill and/or natural soil samples analyzed. No other analyzed parameters were found at levels exceeding the MPCA criteria for soil.
- Detections for DRO in groundwater samples exceeded the Minnesota Department of Health (MDH) Health Based Value (HBV) for total petroleum hydrocarbons, possibly from a petroleum contamination source in the soil.
- Dichlorodifluoromethane, tetrachloroethene, and trichlorofluoromethane were the only compounds detected at concentrations exceeding either ten-times the Residential Intrusion Screening Value (ISV) or ten-times the Industrial ISV. Since VOCs were not detected in soils or groundwater, the source of the detection is unknown.

Based on the information gathered and our professional experience, AET has identified three areas of soil contamination at the Ramsey County Riverfront Properties, one with SVOCs and all three with DRO.

### Recommendations

The following recommendations are based on the findings and opinions above:

1. The presence of contamination above SRVs warrants a Response Action Plan (RAP) to manage associated risks;
2. DRO impacts above regulated fill criteria warrants specialized management or disposal during site preparation;
3. The discovery of petroleum impacts possibly associated with a tank system should be reported to the State in accordance with Statute 115C;
4. Vapor mitigation controls may need to be incorporated during future construction activities depending upon planned use of the Site.

## **1.0 INTRODUCTION**

### **1.1 Site and User Identification**

American Engineering Testing, Inc. (AET) was authorized by Loucks Associates to conduct a Phase II Investigation for the site located at 12/14 & 50 Kellogg Boulevard West in St. Paul, Minnesota. Hereafter, the assessed property will be referred to as the “Site.”

Figure 1 shows the Site location. Appendix A contains a list of the acronyms and abbreviations used in this report.

### **1.2 Purpose**

We have performed a Phase II Investigation to determine if contamination is present at the Site due to recognized environmental conditions (RECs) identified in a previous Phase I Environmental Site Assessment (ESA), with the following objectives:

- To assess the recognized environmental conditions (RECs) identified at the Site, and to evaluate if a release of hazardous substances or petroleum products has occurred as a result of the following:
  - Potential releases to soil from underground storage tanks (USTs) closed in place located in the western building on the Site;
  - Potential soil impacts from the historic rail lines located at the south end of the Site and the adjacent rail lines to the south of the Site;
  - Potential releases to soil from the former printing facility (currently the former West Publishing building) from the use of solvents, oils, and inks;
  - Potential releases to soil from two active aboveground storage tanks (ASTs) holding fuel oil;
- To document the nature and degree of contaminant impacts to environmental media (soil, groundwater, and soil gas media);
- To assess the potential risks to human health or the environment resulting from the detected contaminant impacts under the existing conditions at the Site;

These objectives are based on AET’s understanding of Loucks Associates’ needs and on the Phase II Investigation Work Plan approved by the Minnesota Pollution Control Agency (MPCA).

---

## **2.0 BACKGROUND**

### **2.1 Site Description and Features**

The Site address is 12/14 & 50 Kellogg Blvd W, St Paul, Ramsey County, Minnesota 55102, as well as part of one parcel without a street address. The Site is located in Section 6, Township 28, Range 22. Figure 2 shows the configuration of the Site.

The Site comprises approximately 3.8 acres located in a commercially developed area of St Paul, MN. It is roughly a wedge shape occupied by two connected structures, both of which are currently vacant. The west building is up to 10 stories high and is made up of six structures built over a period of several decades. It was formerly the corporate headquarters of West Publishing, which left in 1991. Since then it has been used as offices for Ramsey County. The east building is 7 stories high and was the county adult detention center and administrative offices. The east building was constructed in 1979 and vacated in 2004. A mostly paved parking lot extends along the south side of both buildings.

At present, neighboring property uses include:

- North: Kellogg Boulevard West runs along the north Site boundary, with downtown mid- and high-rise buildings beyond.
- East: The Wabasha Street bridge abutment is immediately east of the Site, with parkland and parking lots beyond. The land slopes steeply southward along the face of a river bluff.
- South: Union Pacific railroad main lines and a parking lot run along the south Site boundary, with Shepard Road, parkland and the Mississippi River beyond.
- West: The St. Paul District Energy heating/cooling plant is situated immediately west of the Site. The land slopes steeply southward along the face of a river bluff.
- General Vicinity: The Site is located in the heart of downtown St. Paul. As such, previous land uses in the vicinity have included a broad and evolving range of industrial, commercial, and residential purposes.

### **2.2 Physical Setting**

The physical setting of the Site was described in a previous Phase I ESA (AET Project No.02-02098, April 28, 2014).

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

## **2.3 History of Site and Vicinity**

The site has been occupied by stores, a grain elevator and mill, rail lines, a printing and publishing house, a concert and beer garden, a theater, cold storage for meat, fish, and produce, an open market, a stone cutter, a hotel, a detention center with courtrooms, and an office building. The buildings have been associated with coal, underground and above ground storage tanks, and printing inks/solvents. Adjacent property has been occupied by streets, rail lines, and a heating plant.

## **2.4 Previous Environmental Reports**

The results of AET's previous Phase I ESA indicated that there were potential RECs at the Site and that additional assessment of the Site was warranted. The potential RECs included the following:

- The former underground storage tanks because their contents and the dates of their closure are unknown. If they were closed in place prior to concerns regarding leaks from underground tanks, the soils may not have been sampled when the tanks were closed or contamination may have been disregarded.
- The former on-Site rail lines and the adjacent rail lines because, historically, emissions from coal used as fuel in trains have resulted in arsenic, mercury, lead, and semivolatile compound contamination in soils.
- The former printing facility, associated with solvents, oils, and inks, because the trench and floor drains lead to sewer lines that invariably leak and because there is a potential for direct disposal to exposed ground surfaces prior to current environmental practices.
- The current above ground storage tanks because, although they are diked and there are no visible indications of leaks, not all of the containment area is observable.

# **3.0 PHASE II INVESTIGATION ACTIVITIES**

## **3.1 Scope of Services**

The scope of this Phase II Investigation was defined in AET's Phase II Investigation Work Plan which the MPCA approved on July 3, 2014, and includes the following:

- 17 hand-auger soil borings to assess the RECs identified in the AET Phase I ESA and to characterize subsurface conditions inside the buildings at the Site;
  - Per the MPCA's request, two hand-auger soil borings were added to the 15 originally planned;

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

- 6 push-probe soil borings to assess the RECs and to characterize general subsurface conditions outside of the buildings at the Site;
  - Because the accompanying geotechnical exploration was removed from the scope at client request, plans for hollow-stem auger soil borings were modified to use push-probe soil borings instead;
- 3 temporary monitoring wells to characterize potential groundwater impacts at the Site;
  - Because the accompanying geotechnical exploration was removed from the scope at client request, plans for installing permanent monitoring wells were modified to use temporary wells that were sealed after sampling;
- 7 sub-slab vapor port locations (inside) to assess the potential for vapor intrusion risks;
  - Per the MPCA's request, an additional vapor port location was added to the 6 originally planned inside the building;
- 6 vapor probes (outside) to assess the potential for vapor migration risks;
- Perform photoionization detector (PID) field screening of soil and soil-gas samples, and note obvious indications of contamination;
- Collect soil, water and soil-gas samples for laboratory analysis; sample collection depths and parameters depended on the subsurface conditions identified and the concerns being assessed;
- Prepare this Phase II Investigation Report containing the results of the field and laboratory analyses, along with AET's conclusions and recommendations pertaining to the findings.

### **3.2 Additional Research and Data Reviewed**

Additional environmental assessment documents were not available for AET to review during performance of this Phase II Investigation.

### **3.3 Environmental Sampling Rationale**

The Phase II Investigation environmental sample locations were selected to focus on potential contaminant sources as described in Section 2.4 and to achieve a distribution of sampling locations encompassing potential contamination across the Site. Figure 3 shows the Phase II Investigation sampling locations. The sampling methods, depths and analytical parameters were selected to generate data which AET considers useful to achieve the objectives described in the Purpose section of this report.

### **3.4 Environmental Sampling Methods**

Appendix B contains information sheets which detail AET's standard environmental sampling methods. Site-specific considerations or variations from the standard approaches are described in the sections below.

#### ***3.4.1 Field Exploration Technologies***

The field exploration for this Phase II Investigation included Geoprobe borings and vapor probes, hand auger borings, temporary monitoring wells, and sub-slab vapor sampling. Because of significant physical obstructions, the sampling locations were recorded using a hand-held distance measuring wheel to locate points relative to mapped Site features.

Temporary monitoring wells were installed and sampled in accordance with the Minnesota Department of Health (MDH) rules relating to wells and borings. The temporary monitoring well details are on the sealing records in Appendix C.

Temporary vapor probes and sub-slab vapor samples were conducted and sampled in accordance with MPCA guidance document c-s4-06, "Risk-Based Guidance for the Vapor Intrusion Pathway."

#### ***3.4.2 Field Screening Techniques***

Soil samples were screened in the field with a PID equipped with a 10.6 electron volt (eV) lamp to measure organic vapors in parts-per-million (ppm). AET also noted obvious odors and observed the samples for visual evidence of contamination.

#### ***3.4.3 Laboratory Analytical Methods***

AET submitted the soil and groundwater samples to Legend Technical Services, Inc. (Legend) and the vapor samples to Pace Analytical Services, Inc. (Pace) for laboratory analysis. The laboratory analytical reports and chain-of-custody records are provided in Appendix D.

##### *Soil*

Soil samples were analyzed for the chemical parameters below by the methods referenced:

- Diesel range organics (DRO): Wisconsin Department of Natural Resources (WDNR) modified DRO method/United States Environmental Protection Agency (EPA) method 8015D
- Gasoline range organics (GRO): WDNR modified GRO method/EPA method 8015D
- Volatile organic compounds (VOCs): EPA method 8260B

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

- Semi-volatile organic compounds (SVOCs): EPA method 8270D
- Polychlorinated biphenyls (PCBs): EPA method 8082A
- The eight metals of the Resource Conservation and Recovery Act (RCRA) list: EPA methods 6010C and 7471B

**Groundwater**

Groundwater samples were analyzed for the chemical parameters below by the methods referenced:

- DRO: WDNR modified DRO method/EPA method 8015D
- GRO: WDNR modified GRO method/EPA method 8015D
- VOCs: EPA method 8260B
- SVOCs: EPA method 8270D
- The eight metals of the RCRA list: EPA methods 6010C (Dissolved) and EPA 7470A (Dissolved) with field filtered samples

**Soil Gas and Sub-Slab Vapors**

Soil gas and sub-slab vapor samples were analyzed for VOCs using EPA Method TO-15.

***3.4.4 QA/QC Sampling***

Additional samples were collected in accordance with AET's Quality Assurance/Quality Control (QA/QC) guidelines. The results of the QA/QC sample analyses are included in the results tables.

AET collected three blind duplicate soil samples from among the 24 testing locations and one blind duplicate groundwater sample among the 3 testing locations to achieve a minimum frequency of 10% duplicates. The laboratory provided trip blanks for VOCs (soil and water sample) and GRO (water sample).

***3.5 Reference Standards***

In this Phase II Investigation, AET compares the analytical results to the baseline environmental regulatory standards in use by the MPCA. The reference standards are included in the results tables for comparison with assessment results. The media-specific standards are described in the sections below.

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

### ***3.5.1 Soil Standards***

The following reference standards apply to potential contaminant exposures in soils:

- MPCA Tier 1 Residential Soil Reference Values (SRVs): Compound-specific values for long-term soil exposure in unrestricted-use settings (i.e., residential) above which an unacceptable risk to human health is predicted to exist.
- MPCA Tier 2 Industrial SRVs: Compound-specific values for long-term soil exposure in industrial/commercial-use settings.
- MPCA Tier 1 Soil Leaching Values (SLVs): Compound-specific values in unsaturated soils above which an unacceptable risk of leaching to groundwater and/or receptors is predicted to exist.
- DRO and GRO Criterion: SRVs do not exist for DRO and GRO soil impacts. Instead the MPCA Remediation Division applies the guidance document “Best Management Practices for the Off-Site Reuse of Unregulated Fill,” which states that petroleum-impacted soil exhibiting measured DRO or GRO concentrations over 100 milligrams-per-kilogram (mg/kg) or PID screening results over 10 ppm is considered “regulated” for reuse. Stricter standards may apply based on the intended property use, soil management considerations, or local solid waste ordinances.
- PID Screening Criterion: The practical detection limit of a PID is considered to be 1 ppm, although field conditions during sampling may result in higher background measurements.

### ***3.5.2 Groundwater Standards***

The following reference standards apply to groundwater:

- MDH Health Risk Limits (HRLs): Compound-specific values for drinking water in various exposure scenarios above which an unacceptable risk to human health is predicted to exist. AET references the lowest value for a given compound because the MPCA applies the lowest value in risk assessment for groundwater as a potential drinking water source.
- MDH Health Based Values (HBVs) or Risk Assessment Advice (RAAs): Where toxicity data is sufficient to suggest human health risks yet insufficient to set a HRL value, the MPCA applies the provisional HBVs and RAAs.
- EPA Maximum Contaminant Levels (MCLs): Compound-specific values for drinking water “at the tap” above which an unacceptable risk to human health is predicted to exist. AET references the MCLs for compounds with no assigned HRLs, HBVs, or RAAs.

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

### **3.5.3 Soil Gas and Sub-Slab Vapor Standards**

The following reference standards apply to the potential inhalation of vapors by intrusion from contaminated soil gas to indoor air environments:

- MPCA Residential Intrusion Screening Values (ISVs): Compound-specific inhalation risk screening values for VOCs in residential settings due to vapor intrusion. A multiple factor of 10 to 100 times is applied to ISVs to reflect attenuation during vapor intrusion from soils, sub-slab spaces, or groundwater. This report references ten-times the ISV.
- MPCA Industrial ISVs: Compound-specific inhalation risk screening values for VOCs in industrial/commercial settings due to vapor intrusion. A multiple factor of 10 to 100 times is applied to ISVs to reflect attenuation during vapor intrusion from soils, sub-slab spaces, or groundwater. This report references ten-times the ISV.
- PID Screening Criterion: The practical detection limit of a PID is considered to be 1 ppm, although field conditions during sampling may result in higher background measurements.

## **4.0 PROJECT RESULTS**

### **4.1 Field Observations**

AET performed the field exploration and sampling for this Phase II Investigation on July 7-10, 2014. The observational data collected during field exploration activities at the Site are included on the logs in Appendix C.

### **4.2 Soil Boring Observations**

Fill soils were identified in ten borings, ranging from 2 inches to 5.5 feet thick. The observed fill materials generally consisted of silty sand with gravel. Glass was noted in borings B-5 and B-6. Obvious indications of potential environmental impacts such as staining or odor were not noted except for the following:

- Faint petroleum odor noted in B-4
- Solvent-like odor noted in HA-1

Natural alluvial deposits were observed in all six outside borings beneath the fill and/or asphalt. The alluvium consisted of silty sand, some swamp deposits and pieces of limestone. Natural, weathered St. Peter Sandstone bedrock was observed at depths ranging from 0.5 feet below ground surface (bgs) to 20 feet bgs in 18 of the boring and hand-auger locations. Except boring B-3 which did not encounter groundwater, soils appeared wet at 8 feet bgs, and the water levels in borings were measured at 7 to 9 feet bgs.

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

### **4.3 Field Screening Results**

The screening data collected during field exploration activities at the Site are included on the logs Appendix C. PID screening results ranged from 0.0 to 162.8 ppm. The results did not exceed 1 ppm, except in soil borings B-2, B-4, B-5 and HA-1. The results slightly exceeded 10 ppm in B-2 and B-5. In boring B-4, PID screening exceeding 10 ppm ranged from 17.2 ppm to 162.8 ppm.

### **4.4 Laboratory Analysis**

Appendix D includes the laboratory analytical reports and chains-of-custody for this Phase II Investigation. The sections below summarize the laboratory results.

#### ***4.4.1 Soil Analytical Results***

Table 1 summarizes the results of laboratory analyses performed on soil samples. The soil results are reported in milligrams-per-kilogram (mg/kg), which is equivalent to ppm. The reference standards are included on the table for comparison and evaluation of impacts.

##### **DRO**

Laboratory analyses detected DRO in 12 of 24 soil samples analyzed. Detected results ranged from 6.7 to 470 mg/kg in samples B-1(4'-8'), B-2(8'-12'), B-3(4'-8'), B-4(0'-4'), B-5(0'-4'), HA-1(0'-4'), HA-7(0'-1'), HA-8(2'-3'), HA-9(0'-1'), HA-11(0'-1'), HA-13(0'-1'), and HA-16(2'-3'). The measured concentrations of DRO exceeded 100 mg/kg in samples B-3(4'-8'), HA-1(0'-4'), and HA-9(0'-1').

##### **GROs**

Laboratory analyses detected GROs in 2 of 19 soil samples analyzed. The measured results were 43 mg/kg B-2(8'-12') and 5.8 mg/kg B-5(0'-4') which do not exceed the MPCA criterion for unregulated fill (100 mg/kg).

##### **VOCs**

Laboratory analyses detected VOCs in 2 of 24 soil samples analyzed. The measured results did not exceed the MPCA Tier 1 Residential SRVs.

##### **SVOCs**

Environmental laboratories report the analytical results for each SVOC compound separately. In accordance with MPCA guidance, AET normalizes the results for the sub-family of carcinogenic polynuclear aromatic hydrocarbons (cPAHs) to the toxicity of benzo(a)pyrene by applying a

**Phase II Investigation**

AMERICAN  
ENGINEERING  
TESTING, INC.

---

designated “potency equivalency factor” to each compound and calculating the weighted sum as total cPAHs (also known as “BaP equivalents”).

Laboratory analyses detected various SVOCs in 4 of 16 soil samples analyzed. The measured results did not exceed the MPCA criteria, except for the following:

- Total cPAHs greater than the Tier 2 Industrial SRV in sample HA-8(2'-3') and HA-9(0'-1').

**RCRA Metals**

Laboratory analyses detected various RCRA metals in 15 of 15 soil samples analyzed. The measured results did not exceed the MPCA criteria, except for the following:

- Selenium greater than the Tier 1 SLV in sample HA-14(1'-2').

**PCBs**

Laboratory analyses reported no detections for PCBs above the reporting limits for each of the 6 soil samples analyzed.

***4.4.2 Groundwater Analytical Results***

Table 2 lists the results of laboratory analyses performed on groundwater samples. The water results are reported in micrograms-per-liter ( $\mu\text{g/L}$ ), which is equivalent to parts-per-billion (ppb), or milligrams-per-liter (mg/L), which is equivalent to ppm. The reference standards are included on the table for comparison and evaluation of impacts. No detections were measured in groundwater samples except for the following:

**DRO**

Laboratory analyses detected DRO in 3 of 3 groundwater samples analyzed. Detected results ranged from 170 to 590  $\mu\text{g/L}$  in samples B-1, B-2, and B-6. Results for B-2 (230  $\mu\text{g/L}$ ) and B-6 (590  $\mu\text{g/L}$ ) exceeded the MDH HBV of 200  $\mu\text{g/L}$  for Total Petroleum Hydrocarbons (TPH).

**RCRA Metals, Dissolved**

Laboratory analyses detected barium metal in 3 of 3 groundwater samples analyzed. The measured results did not exceed the MDH HRLs.

***4.4.3 Soil Gas and Sub-Slab Vapor Analytical Results***

Table 3 lists the results of laboratory analyses performed on soil gas and sub-slab vapor samples. The vapor results are reported in micrograms-per-cubic-meter ( $\mu\text{g/m}^3$ ); this is not directly

ENGINEERING  
TESTING, INC.

---

equivalent to parts-per-billion by volume (ppbv). The reference standards are included on the table for comparison and evaluation of impacts.

**VOCs – Soil Gas and/or Sub-Slab Vapor**

Laboratory analyses detected various VOCs in 13 of 13 soil gas and sub-slab vapor samples analyzed. The measured results did not exceed ten-times the MPCA Residential ISVs, except for the following:

- Dichlorodifluoromethane greater than ten-times the Residential ISV in sample VP-5 and greater than ten-times the Industrial ISV in sample VP-6;
- Tetrachloroethene greater than ten-times the Residential ISV in samples VP-7 and VP-9;
- Trichlorofluoromethane greater than ten-times the Residential ISV in sample VP-9;

## **5.0 DISCUSSION AND OPINIONS**

### **5.1 Soil**

Subsurface sampling during this Phase II Investigation identified cPAHs greater than the Tier 2 Industrial SRV in sample HA-8(2'-3') and HA-9(0'-1'). In addition, DRO concentrations exceeding the MPCA criterion for unregulated fill were measured in three samples: B-3(4'-8'), HA-1(0'-4'), and HA-9(0'-1'). Figure 4 depicts the soil exceedances for the Site. Based on these measured results, three impacted areas (1, 2, and 3) were identified for the Site and are shown on Figure 6.

Area 1 has cPAH concentrations of 3.6 mg/kg and 27.3 mg/kg that are greater than the MPCA Industrial SRV of 3 mg/kg and would need to be remediated. Areas 1, 2, and 3 contain DRO concentrations greater than the MPCA criterion for unregulated fill (100 mg/kg) with measured results of 470 mg/kg, 140 mg/kg, and 120 mg/kg, respectively. The areas with DRO exceedances would not necessarily need to be remediated unless excavated and removed from the Site.

### **5.2 Water**

DRO and RCRA metals were detected in groundwater samples from borings B-1, B-2 and B-6. In samples B-2 and B-6 results exceeded the MDH HBVs for total petroleum hydrocarbons. Contamination is possibly from a petroleum source in the soil.

**Phase II Investigation**

Ramsey County Riverfront Properties, St. Paul, Minnesota  
August 11, 2014  
AET Report No. 02-02098

AMERICAN  
ENGINEERING  
TESTING, INC.

---

### **5.3 Soil Gas/Sub-Slab Vapor**

The measured VOC concentrations in soil gas and sub-slab vapor samples were greater than ten-times the Residential ISV for dichlorodifluoromethane (VP-5), tetrachloroethene (VP-7, VP-9), and trichlorofluoromethane (VP-9). The results exceeded ten-times the Industrial ISV for dichlorodifluoromethane in VP-6. These exceedances are shown in Figure 5.

### **5.4 Site Contamination Summary**

Based on analytical results for soil, groundwater, soil gas and sub-slab vapor, AET has identified three impacted areas:

- Area 1: cPAH concentrations above the Industrial SRV and DRO concentrations above regulated fill criteria;
- Area 2: DRO concentrations and PID screening results above regulated fill criteria;
- Area 3: DRO concentrations above regulated fill criteria.

Figures 4 and 5 show the contaminants associated with the borings in these areas. Figure 6 shows the designated impact areas.

## **6.0 CONCLUSIONS**

This Phase II Investigation has confirmed the presence of soil, groundwater and soil gas impacts by hazardous substances and petroleum products at the Site under conditions that indicate disposal or release. Within the limitations of the approved scope and Work Plan, this Phase II Investigation has delineated the approximate extent of the identified impacts and evaluated the associated environmental risks based on State regulatory criteria. AET concluded that three impacted areas have been identified:

- Area 1 is impacted with cPAH concentrations above the Industrial SRV and DRO concentrations above regulated fill criteria. The area is located in the portion of the western building known as River Print and is assumed depth of four feet bgs.
- Area 2 is impacted with DRO concentrations and PID screening results above regulated fill criteria. The area is located in the southwest region of the western building, both inside and outside. The assumed depth for the area is eight feet bgs.
- Area 3 is impacted with DRO concentrations above regulated fill criteria, located in the portion of the parking lot just east of where the western and eastern buildings meet. The assumed depth for the area is nine feet bgs.

## 7.0 RECOMMENDATIONS

Based on the observations, findings, and discussion above, AET recommends the following actions be conducted during the planned Site development:

1. The presence of contamination above SRVs warrants a Response Action Plan (RAP) to manage associated risks;
2. DRO impacts above regulated fill criteria warrants specialized management or disposal during site preparation;
3. The discovery of petroleum impacts possibly associated with a tank system should be reported to the State in accordance with Statute 115C;
4. Vapor mitigation controls may need to be incorporated during future construction activities depending upon planned use of the Site.

Please contact AET if assistance is needed to implement the recommendations above.

## 8.0 REPORT CLOSURE

AET has prepared this Phase II Investigation for the exclusive use of Loucks Associates and Ramsey County Property Management for specific application to the Site.

AET has endeavored to perform services for this project in a manner consistent with the level of skill and care ordinarily exercised by other members of the profession currently practicing in this area, under similar budgetary and time constraints. No warranty, express or implied, is made.

This report is based on our current understanding of the project and conditions at the Site. If conditions differing from our original understanding or findings are identified, AET should be consulted to determine if there are material impacts on our conclusions or recommendations.

The data derived through this Phase II Investigation has been used to develop professional opinions about the subsurface and environmental conditions at the Site. However, we recognize that not all critical information may have become known to AET and that no exploration program can fully reveal what is in the subsurface. As a result, there may be impacted locations or media that were not detected, and there may be contaminants present other than those for which we tested given the Purpose and Scope of Services for this Phase II Investigation.

## Legend

Result exceeds MPCA Unregulated Fill Criteria (DBO/GBO)

Res = Residential

Result exceeds MPCA Industrial SRV

Res. Res.

**Bold text** indicated results are greater than laboratory reporting limits.

SLV = Soil Leaching Value

$\leq$  Value does not exceed laboratory reporting limit.

SBV = Soil Reference Value

$\text{mg/kg}$  = milligrams per kilogram

NA = Not analyzed or Not Applicable

MPCA = Minnesota Pollution Control Agency

ND = Not detected

**Table 1**

## Legend

Result exceeds MPCA Unregulated Fill Criteria (DRO/GRO)

Res = Residential

Result exceeds MPCA Industrial SRV!

Ind = Indu

**Bold text** indicated results are greater than laboratory reporting limits

SLV = Soil Leaching Value

< = Value does not exceed laboratory reporting limit

SRV = Soil Reference Value

mg/kg = milligrams per kilogram

NA = Not analyzed or Not Applicable

MPCA = Minnesota Pollution Control Agency

ND = Not detected

**Table 1**

## Summary of Soil Sample Results

## Ramsey County Riverfront Properties

**St. Paul, Minnesota**

AET Project No. 02-02098

### Legend

MDH: Minnesota Department of Health

HRL: Health Risk Limits

\* Value represents the Maximum Contaminant Level (MCL)

\*\* Value represents the Action Level (AL) at the tap

^ Value represents the Health Based Value (HBV)

-- : Not available or applicable

µg/L: microgram per liter

mg/L: milligram per liter

< : Non detect; value does not exceed the laboratory reporting limit

**Bold** indicates value exceeds the laboratory reporting limit

**Bold** indicates value exceeds the reference standard

Environmental Sampling Methods

---

**ENVIRONMENTAL SAMPLING METHODS – GENERAL:  
EXCAVATIONS/TEST PITS, HAND AUGERS, SURFICIAL SOILS, STOCKPILES**

---

**Site Safety Issues**

Safety is of paramount importance on construction, demolition, or other high-traffic sites with potentially unstable ground. Frequent visual and verbal contact is maintained with operators of heavy equipment in the sampling vicinity. Care is taken not to enter depressions or scale mounds that would constitute confined spaces, where engulfment, immersion, or falls are possible, or where harmful vapors may collect. Most observations and soil collection are performed from a stable and level ground surface with the help of heavy equipment operated by an excavation contractor.

**Contamination Reduction**

Sampling devices (except heavy equipment in most cases) are cleaned between sampling points to minimize cross contamination. The cleaning procedure may consist of an alconox detergent-water wash using a brush, followed by a tap water rinse. Certain types of projects may entail more or less stringent decontamination procedures.

**Soil Collection**

Most soil samples from excavations or test pits are collected directly from heavy equipment (e.g., excavation bucket, loader, or bulldozer), giving preference to soils that have not touched the equipment. A hand auger is used to complete shallow soil borings in locations of limited vehicle access. Hand auger borings are advanced manually, typically in 6" to 12" depth intervals. Soils are collected directly from the hollow auger barrel. A spade shovel is used to collect surficial soils (i.e., up to 6" depth). In many cases, soil samples can be collected by hand without added equipment.

Impacted soils or buried debris may be present in the ground that are not observed due to the spacing and depths of sampling points. Best judgment determinations, based on known site conditions and past experience in similar situations, do not guarantee identification or removal of all impacts.

**Soil Classification**

As the samples are obtained in the field, they are visually and manually classified by the field staff. Representative portions of the samples may be returned to the laboratory for further examination and for verification of the field classification. Soil classifications, visual/odor observations, and information on any groundwater encountered are reported on the Soil Screening Data Sheet or other field notes.

**Soil Sample Vapor Screening**

Soil samples collected directly or from equipment are screened with a photoionization detector (PID) for the presence of organic vapors with ionization potentials less than the lamp voltage. The PID is calibrated for direct reading in parts-per-million-volume (PPMv) of a benzene equivalent. Soil samples are collected and screened according to the bag-headspace field screening procedure, which consists of placing freshly collected soil into a polyethylene Whirl-Pak or freezer "baggie" (i.e., bag), sealing the bag to contain an air pocket (i.e., headspace), and allowing 10 to 20 minutes for vapors to disperse from the soil to the headspace. The highest reading upon inserting the PID probe into the bag headspace – typically attained within two to five seconds of probe insertion – is recorded on the Soil Screening Data Sheet or other field notes. Excessive moisture, temperature extremes, ambient vapors, or other unusual field circumstances can affect screening results.

**Other Field Screening**

For certain sites, field screening may be conducted for additional parameters in accordance with AET's Field Screening Methods Supplemental information sheet.

**Soil Sampling for Chemical Analysis**

Soil samples obtained for chemical analysis are collected directly or from the sampling device into laboratory-prepared containers with appropriate preservatives, according to laboratory protocols. The samples are delivered to the analytical laboratory within prescribed holding times, accompanied by proper chain-of-custody forms.

## **ENVIRONMENTAL SAMPLING METHODS – FIELD SCREENING METHODS SUPPLEMENTAL**

---

### **Soil Sample Vapor Screening**

Soil samples collected directly from the field extraction device are screened with a photoionization detector (PID) for the presence of organic vapors with ionization potentials less than the lamp voltage. The PID is calibrated for direct reading in parts-per-million-volume (PPMv) of a benzene equivalent. Soil samples are collected and screened according to the bag-headspace field screening procedure, which consists of placing freshly collected soil into a polyethylene Whirl-Pak or freezer “baggie” (i.e., bag), sealing the bag to contain an air pocket (i.e., headspace), and allowing 10 to 20 minutes for vapors to disperse from the soil to the headspace. The highest reading upon inserting the PID probe into the bag headspace – typically attained within two to five seconds of probe insertion – is recorded on the Soil Screening Data Sheet or other field notes. Excessive moisture, temperature extremes, ambient vapors, or other unusual field circumstances can affect screening results.

### **Soil Sample Lead Screening**

Lead screening is performed in accordance with EPA Method 6010A. Soil samples are collected in 1-mil polyethylene bags and screened with a Niton X-Ray Fluorescence analyzer (XRF). The XRF is calibrated for reading in parts-per-million (ppm) of total lead, according to manufacturer’s specifications. For analysis with the XRF, samples are homogenized within the bags and placed on a flat surface with a minimum 1-cm thickness of soil sample beneath the XRF test guard and shutter. Samples are typically analyzed for approximately 30 seconds – or longer if necessary – to allow stabilization of the measurement. Due to bag interference, XRF screening results may be lower than results obtained by other testing methods for lead content of soils.

### **Soil Vapor or Air Sample Screening**

Soil vapor or air samples collected directly into tedlar bags or summa canisters may be screened with a PID, flame ionization detector (FID), or combustible gas indicator (CGI) for the presence of organic and combustible vapors. The PID is calibrated as above. The FID is calibrated for reading in PPMv of a methane equivalent. The CGI is calibrated for reading in percent of lower explosive limit (%LEL) of a methane equivalent. The CGI also analyzes oxygen in percent (%O<sub>2</sub>). A multi-gas CGI meter may be used to measure %LEL, %O<sub>2</sub>, carbon monoxide in PPMv, and hydrogen sulfide in PPMv. For screening with the PID, FID, or CGI, polyethylene tubing is used to connect the probe to the release valve of the sample bag or canister. The highest reading upon opening the valve – typically attained within two to five seconds – is recorded. Excessive moisture, temperature extremes, ambient vapors, or other unusual field circumstances can affect screening results. In particular, low %O<sub>2</sub> measurements will result in unreliable FID results because oxygen is required for combustion. The CGI instrument is also unreliable in low %O<sub>2</sub> environments unless it utilizes infrared technology for measurement of %LEL.

### **Ambient Air Quality Screening**

Ambient air quality may be screened with a PID, FID, or CGI for the presence of organic and/or combustible vapors. The instruments are calibrated as above. The probe is held in open air; the reported screening result is the highest reading – typically attained within five to ten seconds. Often screening is conducted at different heights to confirm vapors are not accumulating in the breathing zone, at ground level, or other levels. Some fluctuation in readings is expected due to air currents. In addition, excessive moisture, temperature extremes, ambient vapors, or other unusual field circumstances can affect screening results.

### **Field Laboratories**

On certain types of sites (e.g., remedial excavations or groundwater investigations), field laboratories may be used to permit rapid decision-making. All field laboratory services are sub-contracted and conducted in accordance with the subcontractor’s QA/QC procedures. In our experience, regulatory authorities are usually hesitant to rely on field laboratory data alone. Therefore, field laboratory results are typically treated as field screening data. In most cases, a proportion of field samples (typically 10% to 20%) are also submitted to a fixed-base laboratory for confirmation analysis.

### **Contamination Reduction**

The push-probe down hole tooling is steam cleaned prior to mobilization. New clear plastic liners are used for each drive, and the tooling is cleaned between borings to minimize cross contamination. The cleaning procedure consists of an alconox detergent-water wash using a brush, followed by a tapwater rinse. The alconox wash and rinse water are changed regularly – typically between borings. Certain types of projects may entail more stringent decontamination procedures.

### **Soil Boring Advancement and Limitations**

Soil sampling in the soil borings is performed using a Geoprobe® system. Soil borings are advanced using a vehicle-mounted, hydraulically-powered, soil probing machine, which uses static force (vehicle weight) and percussion to advance small-diameter sampling tools into the subsurface for collecting soil core, soil gas, or groundwater samples. Using this system, a 2" outer-diameter (OD) MacroCore® soil sampler containing a 1.75" OD clear plastic liner is driven into the soil in distinct 48" depth intervals, except where subsurface conditions limit the equipment to shorter drive lengths. In cases where soil recovery is poor, typically due to grain-size or moisture, a smaller “discrete” soil sampler (1.5" OD containing a 1.0" OD clear plastic liner) with a retractable piston tip may be used to collect soil in distinct 24" depth intervals. Probe rods are added to extend borings deeper beneath the surface. The plastic liner is removed from the sampler and cut lengthwise to expose discrete sections of soil for classification and sampling.

Unless actually observed, contacts between soil layers are estimated based on the spacing of samples and the action of the push-probe system. Cobbles, boulders, and other large objects generally cannot be recovered from push-probe soil borings, and may be present in the ground even if they are not noted on the boring logs. Impacted soils or buried debris may be present that are not observed due to the spacing and depths of sampling points. Best judgment determinations, based on known site conditions and past experience in similar situations, do not guarantee identification of all impacts.

### **Soil Classification**

As the samples are obtained in the field, they are visually and manually classified by the field staff. Representative portions of the samples may be returned to the laboratory for further observation and for verification of the field classification. Logs of the borings are prepared indicating the depth and identification of the various strata, water level information, and other pertinent information regarding the method of advancing the borings. A chart illustrating the descriptive terminology and symbols used on the borings logs is also provided.

Boring logs include judgments of the geologic depositional origin. This judgment is primarily based on observations of the soil samples, which can be limited. Observations of the surrounding topography, vegetation, and development can sometimes aid this judgment. Visual/odor observations may aid in assessing impacts but are not relied on exclusively.

### **Soil Sample Vapor Screening**

Soil samples collected directly from the sampling liner are screened with a photoionization detector (PID) for the presence of organic vapors with ionization potentials less than the lamp voltage. The PID is calibrated for direct reading in parts-per-million-volume (PPMv) of a benzene equivalent. Soil samples are collected and screened according to the bag-headspace field screening procedure, which consists of placing freshly collected soil into a polyethylene Whirl-Pak or freezer “baggie” (i.e., bag), sealing the bag to contain an air pocket (i.e., headspace), and allowing 10 to 20 minutes for vapors to disperse from the soil to the headspace. The highest reading upon inserting the PID probe into the bag headspace – typically attained within two to five seconds of probe insertion – is recorded on the boring log. Excessive moisture, temperature extremes, ambient vapors, or other unusual field circumstances can affect screening results.

### **Other Field Screening**

For certain sites, field screening may be conducted for additional parameters in accordance with AET's Field Screening Methods Supplemental information sheet.

### **Soil Sampling for Chemical Analysis**

Soil samples obtained for chemical analysis are collected directly from the sampling liner and placed into laboratory-prepared containers with appropriate preservatives, according to laboratory protocols. The samples are delivered to the analytical laboratory within prescribed holding times, accompanied by proper chain-of-custody forms.

### **Water Level Measurements**

The groundwater level measurements are shown at the bottom of the boring logs. The following information appears under Water Level Measurements on the logs:

- Date and time of measurement
- Sampled Depth: greatest depth of soil sampling at the time of measurement
- Cave-in Depth: tape-measured depth of borehole
- Water Level: tape-measured depth of free water in the borehole

The true depth of the water table at the boring locations may be different from the water levels measured in the boreholes. This is possible because several factors can affect the water level measurements in the borehole such as permeability of each soil layer in profile, presence of perched water, amount of time between water-level readings, and weather conditions.

### **Groundwater Sampling for Chemical Analysis**

Groundwater sampling in the boreholes/temporary monitoring wells is performed using a Geoprobe® system. Using this system, a 1.5" OD groundwater sampler with a 41" stainless-steel or PVC screen is driven into the soil to the desired sampling depth using static and percussive forces. The operation of extension rods through the hollow interior of the probe rods enables advancement of the screen beyond the depth of the probe rods while maintaining a closed system above the desired sampling depth.

Using a peristaltic pump or check-valve assembly, samples are pumped directly from the screen through new polyethylene tubing extended to depth through the probe rods. Samples are collected in laboratory-prepared containers with appropriate preservatives, according to laboratory protocols. For analyses in which field-filtering is performed, samples are vacuum-filtered through a new dedicated plastic filter with 0.45- $\mu\text{m}$  pores. The samples are delivered to the analytical laboratory within prescribed holding times, accompanied by proper chain-of-custody forms.

Because boreholes are not typically in equilibrium with ambient groundwater, results provide qualitative groundwater data. Purging additional water prior to sampling may improve the data representativeness somewhat. Monitoring wells are necessary to obtain more accurate quantitative groundwater data.

### **Soil Vapor Probes**

For assessment of vapor encroachment or intrusion into structures, soil vapor sampling is performed using a Geoprobe® system. A 1.25" OD retractable rod with soil vapor adaptor tip is driven into the soil to the desired sampling depth (typically basement floor or base-of-foundation) using static and percussive forces. New polyethylene tubing is attached to the tip, and the rods are retracted approximately 6", creating a closed system. Air samples are pumped through the tubing, and collected in either summa canisters or teflar bags, as approved by regulatory authorities. The samples are delivered to the analytical laboratory within prescribed holding times, accompanied by proper chain-of-custody forms.

As appropriate, bore holes are stabilized in relative equilibrium with air in soil void spaces by removing a minimum of two borehole volumes of air as measured by a flow gauge. Due to the actions of push-probe tools, potential surface leakage, and diffusion from surrounding soils, air samples may not attain equilibrium with the air in soil void spaces; this method is considered a screening measurement.

### **Boring Elevations, Locations, and Abandonment**

Following sampling, ground surface elevations at boring locations are typically measured to the nearest 0.1 foot. If a permanent benchmark of known elevation is unavailable, the measurement is referenced to a nearby temporary benchmark given the arbitrary reference elevation of 100.0 feet. Horizontal location control is typically based on tape measurements from fixed site features. Certain types of projects may entail more stringent measures such as global positioning systems (GPS) or contracting registered surveyors.

Boreholes/temporary monitoring wells are abandoned using appropriate grouting materials and methods. Licensed well contractors on staff ensure compliance with state and local standards.

## ENVIRONMENTAL SAMPLING METHODS – MONITORING WELLS

---

### **Contamination Reduction**

The sampling downrigger and electronic water-level indicator are cleaned prior to sampling and between sampling from different monitoring wells. The cleaning procedure consists of an alconox detergent-water wash and distilled water rinse from spray dispensers. New dedicated teflon bailers are used for each well.

A submersible sampling pump, if used, is steam cleaned prior to mobilization, and decontaminated between sampling from different monitoring wells by pumping through an alconox detergent-water wash and distilled water rinse for several minutes. The alconox wash and rinse water are changed between wells. New dedicated polyethylene tubing is used for each well. Certain types of projects may entail more stringent decontamination procedures.

### **Monitoring Well Installation and Development**

Licensed well contractors on staff ensure that monitoring well construction features comply with the requirements of appropriate state and local agencies. The Monitoring Well/Piezometer Log sheet includes construction and installation details for each well. Typically, monitoring wells are installed in hollow-stem auger (HSA) soil boreholes that have been sampled for environmental parameters. Further information can be found on the information sheet entitled Hollow-Stem Auger Soil Boring Environmental Sampling Methods.

Monitoring wells are developed by removing a minimum of three to five borehole volumes, until water appears clear.

### **Groundwater Elevation Measurements**

Following monitoring well installation, the top-of-riser elevations are surveyed to the nearest 0.01 feet. If a permanent benchmark of known elevation is unavailable, the survey is referenced to a nearby temporary benchmark given the arbitrary reference elevation of 100.00 feet.

Groundwater elevations are determined by using an electronic water-level indicator. Measurements are obtained by lowering the probe into each well until the groundwater surface is encountered. Measurements, referenced to the top-of-riser elevations, are reported on the Groundwater Monitoring Data Sheet to the nearest 0.01 feet.

### **Monitoring Well Stabilization**

Prior to sampling, monitoring wells are stabilized in equilibrium with ambient groundwater by removing a minimum of three to five water-column volumes, until measurements of temperature, pH, specific conductivity, dissolved oxygen (DO), and/or oxidation-reduction potential (ORP) stabilize. Stabilization measurements are recorded on the Groundwater Monitoring Data Sheet.

In addition, water-level measurements may be collected during and after the stabilization process to assess whether the monitoring well is providing water representative of aquifer conditions and to identify deficiencies which may affect recovery rates, static water levels, and representative sampling. Should the water level be drawn down to the bottom of a monitoring well, water-level recovery rates are measured in lieu of stabilization measurements.

### **Groundwater Sampling for Chemical Analysis**

Groundwater samples obtained for chemical analysis are collected directly from each monitoring well using a new dedicated teflon bailer lowered down the well with new nylon rope or decontaminated downrigger cable. Samples are decanted directly from the bailer into laboratory-prepared containers with appropriate preservatives. Alternatively, samples may be drawn directly from the submersible pump discharge tubing. For analyses in which field-filtering is required, samples are vacuum-filtered through a new dedicated plastic filter with 0.45- $\mu\text{m}$  pores. The samples are delivered to the analytical laboratory within prescribed holding times, accompanied by proper chain-of-custody forms.

When field measurements are required (e.g., nitrate-nitrogen, dissolved iron, hydrous sulfide, residual chlorine), brand-name field testing kits are used in accordance with manufacturers' specifications and state agency requirements.

## BORING LOG NOTES – PUSH PROBES & GENERAL SAMPLING METHODS

---

### PUSH-PROBE AND GENERAL SAMPLING SYMBOLS

<b>Symbol</b>	<b>Definition</b>
D:	Dry
DR:	Driller (initials)
DS:	Geoprobe MacroCore® discrete interval sampler
F:	Frozen
FT:	Feet
GP:	Geoprobe® push-probe subsurface sampling system
HA:	Hand auger
HSA:	Hollow stem auger
IN:	Inches
LG:	Field logger (initials)
M:	Moist
MC:	Column used to describe moisture condition of samples and for the ground water level symbols
MC:	Geoprobe MacroCore® continuous sampler
N (BPF):	Standard penetration resistance (N-value) in blows per foot
NR:	No recovery
REC:	The recovered length (in inches) of sample
SS:	Standard split-spoon sampler
TP:	Test pit
W:	Wet/waterbearing
▼:	Water level directly measured in boring
▽:	Estimated water level based solely on sample appearance

### TEST SYMBOLS

<b>Symbol</b>	<b>Definition</b>
CGI:	Combustible gas indicator
DEN:	Dry density, pcf
FID:	Flame ionization detector
HYD:	Hydrometer analysis
LL:	Liquid Limit, %
ND:	Not detected
OC:	Organic Content, %
PID:	Photoionization detector measurement of headspace organic vapors
PL:	Plastic Limit, %
PPM:	Parts per million
or PPMv:	Parts per million by volume
SA:	Sieve analysis
XRF:	X-ray fluorescence measurement of total lead
WC:	Water content, as percent of dry weight
%<200:	Percent of material finer than #200 sieve

### USC\* SOIL TYPE DESIGNATIONS

<b>Symbol</b>	<b>Definition</b>
CH:	Fat clay
CL:	Lean clay
GC:	Clayey gravel
GM:	Silty gravel
GP:	Poorly graded gravel
GW:	Well graded gravel
MH:	Elastic silt
ML:	Silt
OH:	Organic clay or silt (fat)
OL:	Organic clay or silt (lean)
PT:	Peat
SC:	Clayey sand

Work Order Number: 1403007  
RE: 02-02098 Ramsey County-Loucks

Enclosed are the results of analyses for samples received by the laboratory on 07/10/14. If you have any questions concerning this report, please feel free to contact me.

Results are not blank corrected unless noted within the report. Additionally, all QC results meet requirements unless noted.

All samples will be retained by Legend Technical Services, Inc., unless consumed in the analysis, at ambient conditions for 30 days from the date of this report and then discarded unless other arrangements are made. All samples were received in acceptable condition unless otherwise noted.

All test results and QC meet requirements of the 2003 NELAC standard.

MDH (NELAP) Accreditation #027-123-295

**Shipping Container Information**

**Cooler 1** Temperature (°C): -0.3

Received on ice: Yes Temperature blank was present  
Received on melt water: No Ambient: No  
Custody seals: No

Received on ice pack: No  
Acceptable (IH/ISO only): No

**Cooler 2** Temperature (°C): 5.8

Received on ice: Yes Temperature blank was present  
Received on melt water: No Ambient: No  
Custody seals: No

Received on ice pack: No  
Acceptable (IH/ISO only): No

**Case Narrative:**

The DRO surrogate recovery exceeded laboratory limits for Sample HA-9(0-1) due to matrix interferences and sample dilution required from high analyte concentration.

### Notes and Definitions

- T-1 MDH does not offer certification for this parameter.
- S-GC Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
- S-04 The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
- QR-2 Analyses are not controlled on RPD values from sample concentrations less than 5 times the reporting limit.
- PH2 Insufficient preservative to reduce the sample pH to less than 2.
- M2 Matrix spike recovery was low, the associated blank spike recovery was acceptable.
- M Results in the diesel organics range contain hydrocarbons more volatile than DRO.
- L1 Results in the diesel organics range are primarily due to overlap from a heavy oil range product.
- H Results in the gasoline range contain hydrocarbons less volatile than GRO.
- < Less than value listed
- dry Sample results reported on a dry weight basis
- NA Not applicable. The %RPD is not calculated from values less than the reporting limit.
- MDL Method Detection Limit
- RL Reporting Limit
- RPD Relative Percent Difference
- LCS Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
- MS Matrix Spike = Laboratory Fortified Matrix (LFM)

## REVIEWED

By Calista Timmerman at 1:50 pm, Aug 11, 2014

Ms. Camilla Pederson  
American Engineering Testing, Inc.  
550 Cleveland Ave N  
St. Paul, MN 55114

Work Order Number: 1403022  
RE: 02-02098 Ramsey County-Loucks

Enclosed are the results of analyses for samples received by the laboratory on 07/10/14. If you have any questions concerning this report, please feel free to contact me.

Results are not blank corrected unless noted within the report. Additionally, all QC results meet requirements unless noted.

All samples will be retained by Legend Technical Services, Inc., unless consumed in the analysis, at ambient conditions for 30 days from the date of this report and then discarded unless other arrangements are made. All samples were received in acceptable condition unless otherwise noted.

All test results and QC meet requirements of the 2003 NELAC standard.

MDH (NELAP) Accreditation #027-123-295

Project: 02-02098 Ramsey County-Loucks  
Project Number: 02-02098  
Project Manager: Ms. Camilla Pederson

Work Order #: 1403022  
Date Reported: 07/24/14

### Notes and Definitions

T-1	MDH does not offer certification for this parameter.
PH2	Insufficient preservative to reduce the sample pH to less than 2.
L1	Results in the diesel organics range are primarily due to overlap from a heavy oil range product.
<	Less than value listed
dry	Sample results reported on a dry weight basis
NA	Not applicable. The %RPD is not calculated from values less than the reporting limit.
MDL	Method Detection Limit
RL	Reporting Limit
RPD	Relative Percent Difference
LCS	Laboratory Control Spike = Blank Spike (BS) = Laboratory Fortified Blank (LFB)
MS	Matrix Spike = Laboratory Fortified Matrix (LFM)

RE: Project: 02-02098  
Pace Project No.: 10273601

Dear Camie Pederson:

Enclosed are the analytical results for sample(s) received by the laboratory on July 10, 2014. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Lori Castille

## QUALIFIERS

Project: 02-02098  
Pace Project No.: 10273601

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### SAMPLE QUALIFIERS

Sample: 10273601001

[1] The Total Hydrocarbon (THC) pattern occurred in the first half of the chromatogram (before toluene).

Sample: 10273601002

[1] The Total Hydrocarbon (THC) pattern occurred in the first half of the chromatogram (before toluene).

Sample: 10273601003

[1] The Total Hydrocarbon (THC) pattern is evenly distributed throughout the chromatogram (before and after toluene).

Sample: 10273601004

[1] The Total Hydrocarbon (THC) pattern is evenly distributed throughout the chromatogram (before and after toluene).

Sample: 10273601005

[1] The Total Hydrocarbon (THC) pattern is evenly distributed throughout the chromatogram (before and after toluene).

Sample: 10273601006

[1] The Total Hydrocarbon (THC) pattern occurred in the second half of the chromatogram (after toluene).

Sample: 10273601007

[1] The Total Hydrocarbon (THC) pattern occurred in the second half of the chromatogram (after toluene).

Sample: 10273601008

[1] The Total Hydrocarbon (THC) pattern occurred in the second half of the chromatogram (after toluene).

Sample: 10273601009

[1] The Total Hydrocarbon (THC) pattern occurred in the second half of the chromatogram (after toluene).

Sample: 10273601010

[1] The Total Hydrocarbon (THC) pattern occurred in the second half of the chromatogram (after toluene).

## QUALIFIERS

Project: 02-02098  
Pace Project No.: 10273601

---

### SAMPLE QUALIFIERS

Sample: 10273601011

- [1] The Total Hydrocarbon (THC) pattern occurred in the first half of the chromatogram (before toluene).

Sample: 10273601012

- [1] The Total Hydrocarbon (THC) pattern occurred in the first half of the chromatogram (before toluene).

Sample: 10273601013

- [1] The Total Hydrocarbon (THC) pattern occurred in the second half of the chromatogram (after toluene).

### ANALYTE QUALIFIERS

- A3 The sample was analyzed by serial dilution.  
E Analyte concentration exceeded the calibration range. The reported result is estimated.
